

Matplotlib.

can to visualize the data in the graph format using the python.

(`import matplotlib.pyplot as plt`) — for importing matplotlib

eg.

```
import matplotlib.pyplot as plt
import numpy as np
x = np.array([0, 6]) — x axis
y = np.array([0, 250]) — y axis
plt.plot(x, y) — for plotting (x, y)
plt.show() — for showing i.e. visualising the output.
```

we can change the • format default it will give line graph we can change it to any symbol such as •, +, --, etc • just by adding condition as

```
plt.plot(x, y, 'ro')
or
plt.plot(x, y, '+') or plt.plot(x, y, '--')
```

we can change color of symbol by writing it as 'ro' (red o) or bo (blue o) or 'rt' (red t) or 'yt' (yellow t). etc.

line

note

If we didn't mention the x axis points, it will take the default values as 0, 1, 2, 3, 4, etc.

~~line~~ line width can be used to give width to the line

ex.

```
plt.plot(x, y, line width = '20.5')
```

We can do multiple plotting by simply adding one more `plt.plot()`

ex.

```
import matplotlib.pyplot as plt
import numpy as np
```

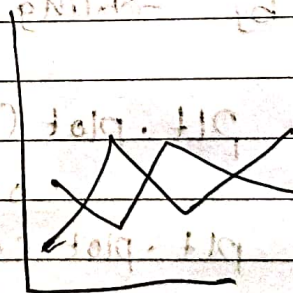

```
y1 = np.array([3, 8, 1, 10])
```

```
y2 = np.array([6, 2, 7, 11])
```

```
plt.plot(y1)
```

```
plt.plot(y2)
```

```
plt.show()
```

also we can add many lines by simply using separate `x1, y1, x2, y2` as variable.

Label
of Title

classmate

Date
Page

we can label the axis by using

```
plt.xlabel("")
```

```
plt.ylabel("")
```

ex.

~~plot~~

```
x = np.array([1, 2, 3, 4])
```

```
y = np.array([2, 8, 10, 12])
```

~~plt~~

```
plt.xlabel("years")
```

```
plt.ylabel("days")
```

```
plt.plot(x, y)
```

```
plt.show()
```

by using `plt.title()`

we can give the title to the graph.

we can use font dict for different fonts

```
import matplotlib.pyplot as plt
```

```
import numpy as np
```

```
x = np.array([1, 2, 3, 4])
```

```
y = np.array([3, 4, 5, 6])
```

```
font1 = {'family': 'serif', 'color': 'blue', 'size': 20}
```

```
font2 = {'family': 'serif', 'color': 'red', 'size': 15}
```

```
plt.title("Sports data", fontdict = font1)
```

```
plt.xlabel("Avg pulse", fontdict = font2)
```

```
plt.ylabel("calorie", fontdict = font2)
```

```
plt.plot(x, y)
```

```
plt.show()
```

we can align the position of the
by mentioning loc = 'left' or 'right'

```
plt.title("Sport data", loc='left')
```

adding grid lines to plot we use

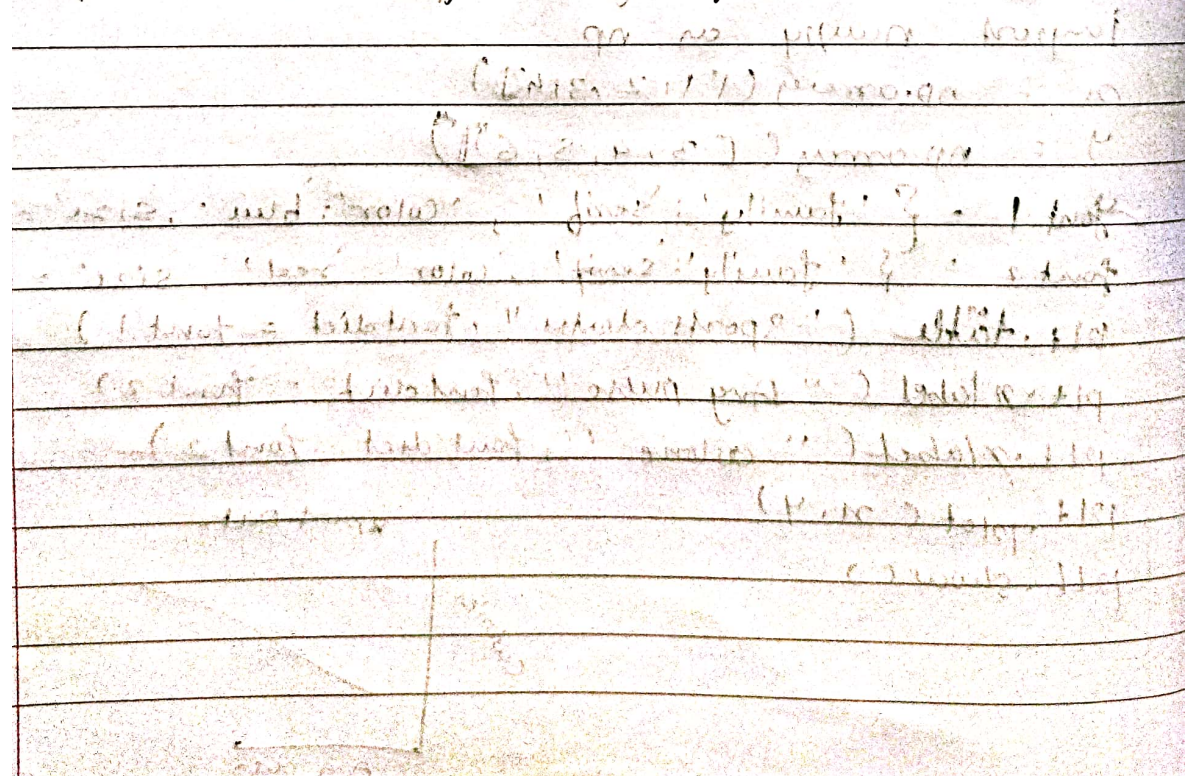

```
plt.grid()
```

we can specify the axis to add grid for
specific axis like

```
plt.grid(axis='x') # for x-axis
```

we can also grid line properties like

```
plt.grid(color='gray', linestyle='dashed', linewidth=2)
```

matplotlib Subplot

Subplot() used to draw multiple plots in one figure.

subplot — 11 —

subplot — 1 —

x = np.array([0, 1, 2, 3])

y = np.array([5, 8, 1, 10])

plt.subplot(1, 2, 3)

plt.plot(x, y)

} #plot 1

~~#plot~~

x = np.array([0, 1, 2, 3])

y = np.array([10, 20, 30, 40])

plt.subplot(1, 2, 2)

plt.plot(x, y)

plt.show()

" # figure has 1 row, 2 column, & this will be first (1, 2, 1)
figure has 1 row, 2 column, & this will be second (1, 2, 2)

We can change position by simply (2, 1, 1)
(2, 1, 2)

graph 1

graph 2

✳ Supertitle() used to give supertitle
& title for all graphs

Matplotlib Scatter

```
plt.scatter(x, y)
```

Colour map,

~~cmmap~~

```
plt.scatter(x, y, c=colormap='viridis')
```

Alpha use for transparency

Bars.

```
plt.bar(x, y)
```

```
plt.barh(x, y) #horizontal bar
```
